EXPERIENCE

TestMachine AI

CTO; First Employee — *May 2022 – October 2026*

- Built an AI security startup from inception to 20 employees; our platforms achieved state-of-the-art results on public benchmarks and discovered a critical 0-day vulnerability in hardware wallets securing billions of dollars of user funds;
- Personally built the reinforcement-learning prototype for smart-contract security that validated the business, then hired a team to productize it, shifting to early adoption of agentic products as the technology emerged;
- Won a multi-year, seven-figure contract with Coinbase and managed the relationship from early product development through production deployment, working directly with their security and engineering teams;
- Scaled our platform to 150k+ asset analyses per day, automating Coinbase's asset onboarding, replacing a weeks-long manual process with one that took minutes, enabling secure decentralized-exchange mechanics for the first time;
- Built the engineering organization from the ground up, hiring and leading engineers across R&D, product, and security, and drove the shift to AI-native development, redesigning team structure, workflows, and operations as the tech evolved

Disclose

Co-Founder (part-time) — *May – September 2026*

- Led product, engineering, and data for an AI-native fintech platform for political committees and non-profits, from conceptualization with potential customers to pilot customers and commitments for $17M AUM

Environmental Investigation Agency

Chief Technology Architect — *January 2021 – January 2023; Advisor January 2023 – Present*

- Architected and led the implementation of a national timber-traceability system for the Government of Gabon, digitizing the country's supply chain operations end to end and giving businesses and regulators a unified system of record to improve clarity and tax collection and reduce fraud;
- Worked directly with government officials, businesses, and operators across the supply chain to understand both the existing regulatory environment and the practices on the ground to implement a first version of the system and write a roadmap for regulatory and technical improvements;
- Built chain-of-custody traceability providing unified digital records from origin inventory to export, reaching 85% of timber volume in the country recorded digitally within 2 years, and designed interoperability into the records from the start to enable global firms to propagate origin information throughout the transport and production process;
- Established an eight-person sub-grantee organization to deliver the program, owning hiring, team formation, technical execution, and coordination with funding and government stakeholders;
- Designed and implemented a multimodal deep-learning anomaly detection system to identify fraudulent transactions, leading to dozens of enforcement actions and an estimated 72% reduction in fraud across the national supply chain

Michigan Aerospace Corporation

Machine Learning Engineer — *February 2019 – October 2020*

- Built and owned the TB-scale data processing pipeline for HALAS, a laser system that monitors weather conditions through the thermosphere in support of DoD, NASA, and SpaceX flight testing (HALAS later acquired by Honeywell);
- Developed a deep learning and Markov chain Monte Carlo system to identify and predict invasive species distributions in aerial drone imagery of wildlife preserves;
- Led a team of three engineers taking a machine-learning product from prototype to production, giving scientists and land managers a tool to upload and analyze multimodal datasets

Microsoft

Software Engineer Intern — *May 2018 – August 2018*

- Implemented and deployed a distributed packet capturing system on Azure to enable more efficient cluster debugging

EDUCATION & SKILLS

University of Michigan

Master of Science in Computer Science and Machine Learning — *April 2021*
BSE in Computer Science and Engineering — *April 2019*

Selected Languages and Tools: Rust, Go, Python, TypeScript, Terraform, AWS, SQL, Docker, Kubernetes, GitHub Actions, Coding Agents (Claude Code, Codex, Amp Code), Agent Assistants (Grok Bot)
